

NEAT Liquid Biopsy Kit User Guide

Automated cfDNA Isolation on KingFisher Apex/Flex System with 4 mL of Plasma Collected in a K2EDTA Blood Collection Tube or a PAXgene Blood ccfDNA Tube

This protocol is optimized to capture and concentrate cfDNA while excluding genomic DNA from 4 mL of plasma collected in K2EDTA Blood Collection Tubes or PAXgene® Blood ccfDNA Tubes with a user-friendly method for running up to 24 samples at once. This protocol utilizes a KingFisher™ Apex System or a KingFisher™ Flex System for sample processing.

This protocol involves two serial runs on the KingFisher System. The first run is in a 24-well format, and at the end the cfDNA is in Nanotrap® Transfer. The Nanotrap Transfer solution is moved to a new 96-well plate for the second run of the KingFisher System protocol. After run-one, multiple plates can be combined into a 96-well format and run on method two. At the end of the second run, the captured and concentrated cfDNA is in Nanotrap® Elute and ready for downstream analysis.

Kit Contents and Equipment Lists

Automated Scripts for KingFisher Apex and Flex

For KingFisher scripts, contact sales@ceresnano.com.

4 mL [K2EDTA Tube or PAXgene ccfDNA Tube Plasma]

- KingFisher Apex: 24_4mL_NEATLB_APEX_V1 and 96_4mL_NEATLB_APEX_V1- KingFisher Flex: 24_4mL_NEATLB_FLEX_V1 and 96_4mL_NEATLB_FLEX_V1

Troubleshooting

- Ensure that all reagents are stored at the indicated temperatures.
- Make sure that refrigerated reagents and plasma samples (if applicable) are warmed to room temperature before starting the procedure.
- Nanotrap® Liquid Biopsy Particles and Nanotrap® Bind reagents must be adequately vortexed immediately before each use.
- Nanotrap® Elute must be pipetted carefully into the bottom center of each well.
 - Spin plate to bring content to bottom center if needed.
- Seal the Ethanol Wash plate or Elution plates during the first run to avoid reagent evaporation and unseal just before loading the second run, for protocols that involve two KingFisher System runs.

- Do not allow the Nanotrap Bind to dry out in the "Bind" plate prior to adding the Nanotrap Transfer solutions and ensure that it is properly pipetted into the bottom center of the wells.
- Add the reagents in the order listed in the corresponding procedure.
 - Do not mix Nanotrap Liquid Biopsy Particles directly with Nanotrap® Proteinase K.
- Avoid using plasma samples that have undergone a freeze-thaw cycle for optimal sample integrity.

Kit Guidelines

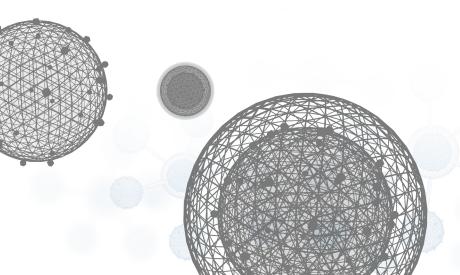

- If using the NEAT Liquid Biopsy Kit for the first time:
 - Resuspended Proteinase K should be aliquoted and stored for up to 12 months at −15 to −25°C.
 Avoid repeated freezing and thawing as this may lead to precipitation of the protein.
- Reagent Preparation:
 - Prepare an 80% ethanol solution using 100% laboratory grade ethanol and molecular biology grade water.
- Perform all steps in the protocols at room temperature (15°C to 30°C):
 - Allow Nanotrap Liquid Biopsy Particles, Nanotrap Proteinase K, and plasma sample(s) to reach room temperature.
 If plasma sample is frozen, it may be placed at up to 37°C until fully thawed.
- Nanotrap Liquid Biopsy Particles and Nanotrap Bind must be vortexed for at least 30 seconds immediately before each use to ensure that the component is fully resuspended.

Preparation of Plasma from Whole Blood

1. Centrifuge whole blood samples according to the blood collection tube manufacturer guidelines. Carefully transfer plasma to a new tube (or directly to sample plates).

Only one spin is needed for use with the NEAT Liquid Biopsy Kit.

Note: After transferring plasma samples to a new tube, see manufacturer guidelines for recommended plasma storage.

First Run

Procedure Setup

- 1. Collect and label (5) KingFisher™ 24 Deep-well Plates, as follows: "Tip Comb 1," "Lyse 1," "Lyse 2," "Wash," and "Transfer."
- 2. Collect and place a KingFisher™ 24 Deep-well Tip Comb into the "Tip Comb 1" plate and set aside for *KingFisher Protocol,* First Run.

Prepare Lyse Plates

Important Note: A plasma sample is divided between the same wells of the "Lyse 1" and "Lyse 2" plates. For example, place half the input volume of plasma sample A into well A1 of the "Lyse 1" plate and the remaining input volume of plasma sample A into well A1 of the "Lyse 2" plate. Next, repeat with plasma sample B into well A2, and so on.

"Lyse 1" and "Lyse 2" plates are identical in layout and contents. FILL IN ORDER:

- 1. Invert the plasma tube(s) gently 5 times.
- 2. Add **2000 μL** of **plasma** into the "Lyse 1" 24 deep-well plate, then add **2000 μL** of the same **plasma** sample into the corresponding well placement in the "Lyse 2" 24 Deep-well plate.
- 3. Vortex Nanotrap Liquid Biopsy Particles for 30 seconds to resuspend.
- Add 500 μL of Nanotrap Liquid Biopsy Particles to each well containing a plasma sample in plates "Lyse 1" and
 "Lyse 2."
- 5. Add 100 µL of Nanotrap Proteinase K to each well containing a plasma sample in plates "Lyse 1" and "Lyse 2".
- Add 650 µL of Nanotrap® Lyse to each well containing a plasma sample in plates "Lyse 1" and "Lyse 2."

Prepare Wash and Transfer Plates

Important Note: Add reagents to the specified plates in the corresponding wells that contain plasma samples. For example, if there are plasma samples in wells A1–A3 in the "Lyse 1" and "Lyse 2" plates, add reagent to wells A1–A3 in the subsequent plates.

- 1. Add **1000 μL** of Nanotrap® Wash to the "Wash" 24 deep-well plate for each plasma sample.
- 2. Add 500 µL of Nanotrap Transfer to the "Transfer" 24 deep-well plate for each plasma sample.

KingFisher Protocol, First Run

- Download and start the KingFisher script and follow the on-screen instructions to load the prepared "Tip Comb 1,"
 "Lyse 1," "Lyse 2," "Wash," and "Transfer" plates into the instrument and run the protocol.
 - KingFisher APEX Script: 24_4mL_NEATLB_APEX_V1.kfx
 - KingFisher FLEX Script: 24_4mL_NEATLB_FLEX_V1.bdz
- 2. At the completion of the first KingFisher run, remove the plates from the KingFisher system as prompted. **Do not discard the "Transfer" Plate.** The "Transfer" Plate now contains the cfDNA that was captured from the plasma samples and will be used in the KingFisher Protocol, Second Run. cfDNA in Transfer buffer may be sealed and stored for up to one hour at room temperature.

Second Run

Procedure Setup

- Collect and label (4) KingFisher™ 96 Deep-well Plates, as follows: "Tip Comb 2," "Bind," "Ethanol Wash 1," and "Ethanol Wash 2."
- 2. Collect and label (1) KingFisher™ 96 Plate (200 μL), as follows: "Elute."
- 3. Collect and place a KingFisher™ 96 Deep-well Tip Comb into the "Tip Comb 2" Plate and set aside for KingFisher Protocol, Second Run.

Prepare Ethanol Wash and Elution Plates

Important Note: Add reagents to the specified plates in the corresponding wells for the number of plasma samples used.

- 1. Add 250 µL of 80% Ethanol to the "Ethanol Wash 1" 96 deep-well plate for each sample.
- 2. Add 60 μL of 80% Ethanol to the "Ethanol Wash 2" 96 deep-well plate for each sample.
- 3. Add **20 \muL** of **Nanotrap Elute** to the "Elute" 96 plate (200 μ L) for each sample, carefully pipetting directly to the bottom center of the well.
- 4. Cover the "Ethanol Wash 1," "Ethanol Wash 2," and "Elute" plates with parafilm or a plate sealing film and set aside for *KingFisher Protocol, Second Run*.

Note: These plates may be prepped after the KingFisher Protocol, First Run, at user discretion.

Prepare Bind Plate

- 1. Vortex the Nanotrap Bind for 30 seconds to resuspend.
- 2. Add **30 μL** of **Nanotrap Bind** to the "Bind" plate for each plasma sample used to the corresponding well placement in the "Ethanol Wash 1," "Ethanol Wash 2," and "Elute" plates.
- 3. Pipette all the **Nanotrap Transfer** from each well of the "Transfer" plate, taken from the KingFisher System after the first run, to the "Bind" plate to the corresponding wells that now contain Nanotrap Bind.

KingFisher Protocol, Second Run

- 1. Collect the filled "Ethanol Wash 1," "Ethanol Wash 2," and "Elute" plates and remove plate covers.
- 2. Download and start the KingFisher script and follow the on-screen instructions to load the prepared "Tip Comb 2," "Bind," "Ethanol Wash 1," "Ethanol Wash 2," and "Elute" plates into the instrument and run the protocol.
 - KingFisher APEX Script: 96_4mL_NEATLB_APEX_V1.kfx
 - KingFisher FLEX Script: 96_4mL_NEATLB_FLEX_V1.bdz
- 3. After the second KingFisher run is completed, remove the plates from the KingFisher System as prompted.
- 4. Cover the "Elute" plate with parafilm or a plate sealing film and save until ready for use. This plate contains the concentrated cfDNA.

Samples are ready for analysis.

For optimal sample integrity, it is strongly advised to use them immediately. Store samples at 4°C for same-day use or at -80°C for long-term storage.

QUICK GUIDE: Automated 4 mL of Plasma Collected in a K2 EDTA Blood Collection Tube or a PAXgene Blood ccfDNA Tube

NEAT Liquid Biopsy Kit Quick Guide 4 mL KingFisher Automated cfDNA isolation	
KingFisher Plate	Reagents Added
Tip Comb 1 24 Deep-well Plate + Tip Comb	NONE
Lyse 1 24 Deep-well Plate	2000 μL plasma from K2-EDTA Blood Collection Tubes or PAXgene Blood ccfDNA Tubes
	500 μL NEAT Liquid Biopsy Particles
	100 μL Nanotrap Proteinase K
	650 μL Nanotrap Lyse
Lyse 2 24 Deep-well Plate	2000 μL plasma from K2-EDTA Blood Collection Tubes or PAXgene Blood ccfDNA Tubes
	500 μL NEAT Liquid Biopsy Particles
	100 μL Nanotrap Proteinase K
	650 μL Nanotrap Lyse
Wash 24 Deep-well Plate	1000 μL Nanotrap Wash
Transfer 24 Deep-well Plate	500 μL Nanotrap Transfer
Run KingFisher Script: 24_4mL_NEATLB_APEX_V1 or 24_4mL_NEATLB_FLEX_V1	
Manual Transfer of Nanotrap Transfer Solution to Bind Plate	
Tip Comb 2 96 Deep-well Plate + Tip Comb	NONE
Bind 96 Deep-well Plate	30 μL Nanotrap Bind
	500 μL Transfer Plate Solution <i>(manually transferred)</i>
Ethanol Wash 1 96 Deep-well Plate	250 μL 80% Ethanol
Ethanol Wash 2 96 Deep-well Plate	60 μL 80% Ethanol
Elute 96 Plate (200μL)	20 μL Nanotrap Elute
Run KingFisher Script: 96_4mL_NEATLB_APEX_V1 or 96_4mL_NEATLB_FLEX_V1
